RESEARCH, DEVELOPMENT AND TESTS OF HIGH PERFORMANCE AIRCRAFT MACHINE GUN FUZES

22nd Partial Report

TESTS OF OERLIKON BZ AND KZ FUZES FOR 20MM AMMUNITION

FINAL Report

Task
Assignment NPG-Re2b-227-1-53

Copy No.

Classification <u>CONFIDENTIAL</u> SECURITY INFORMATION

### PART A

### SYNOPSIS

- l. This test was conducted to determine: the functioning performance and/or sensitivity of the Oerlikon KZ and BZ fuzes against various targets at various obliquities, the approximate delay of fuze action, the distance from the muzzle where the fuzes armed, and the time and range of self-destruction.
- 2. It is concluded from the results obtained that:
- a. The KZ and BZ fuzes gave no bore or flight premature detonations when fired as single rounds from the Oerlikon 5TG gun.
- b. The BZ base fuze assembled in the PS/B armor piercing explosive projectile when fired with mean velocities of 3254 to 3315 ft/sec:
- (1) Was unstable in flight and fuze functioning was not determinable.
- (2) Gave a slightly better functioning performance but yawed slightly more with projectiles known to have lead in the cavity. (Based upon limited comparative firings of projectiles with and without lead in the cavity.)
- (3) Exhibited a 92% self-destruction performance at an average range of 2287.4 yards from the muzzle with an average flight time of 4.60 seconds.
- (4) Detonated with delayed fuze action of approximately .001 second when fired against a 01125 mild steel target.
- c. The KZ nose fuze assembled in the SS/K explosive projectile when fired with mean velocities of 3619 to 3731 ft/sec:
- (1) Functioned 100% versus 0"125 24S-T3 aluminum alloy and all heavier targets employed at 0° obliquity.
- (2) Functioned 100% against 0"020 245-T3 aluminum alloy at 30° obliquity and against 0"125 245-T3 aluminum alloy at 80° obliquity.

- (3) Gave a functioning performance of 80% or greater against: 0"020 24S-T3 aluminum alloy at obliquities of 0° to 70°, 0"125 24S-T3 aluminum alloy at obliquities of 0° to 80°, and versus 0"190 Beaverboard, 0"040 24S-T3 aluminum alloy, and 0"016 24S-T3 clad aluminum alloy at 0° obliquity.
- (4) Was sensitive enough to function 40% on 0,020 Blotter paper at 0° obliquity.
- (5) Was not armed at 50 feet from the muzzle, but was fully armed at a distance of 500 feet from the muzzle when fired against a target of 0".125 mild steel.
- (6) Exhibited an 88% sclf-destruction performance at an average range of 2842.3 yards with an average flight time of 5.47 seconds.
- (7) Detonated with delayed fuze action of approximately .00015 second when fired against thin targets of 0.016 to 0.040 24S-T3 aluminum alloy at 0 obliquity.

### PART B

### INTRODUCTION

### 1. AUTHORITY:

The subject test was conducted under reference (a), Task Assignment NPG-Re2b-327-1-53, as authorized by reference (b), and in accordance with references (c), (d), (e), and (f).

### 2. REFERENCES:

- (a) BUORD Conf 1tr Re2b-DBLaP:bjn NP9 Ser 42738
- of 29 July 1952 NOL Conf ltr TF:DEL:hcw NP/NCL/X1-1 (3026) Ser 01725 (b) of 6 August 1952

### BACKGROUND: 3.

The Naval Ordnance Laboratory requested the Naval Proving Ground by reference (b) to assist in the evaluation of two (2) new types of 20mm fuzes manufactured by the Oerlikon Machine Tool Works, Buchrle and Company, Zurich-Oerlikon, Switzerland. Type KZ is a nose fuze with mechanical self-destruction and a prolonged muzzle safety feature. Type BZ is a base fuze with a mechanical selfdestruction feature. The KZ fuze is assembled in a high explosive projectile and the BZ fuze is assembled in a semi-armor piercing projectile. This report covers the tests as requested in paragraphs A2, B1, and B2 of reference (c), paragraphs 1 and 2 of reference (d), paragraphs 1 and 2 of reference (e), and paragraphs 1 and 2 of reference (f).

### OBJECT OF TEST: 4.

These tests were conducted to determine: the functioning performance and/or sensitivity of the KZ and BZ Oerlikon fuzes against various targets at various obliquities, the approximate delay of fuze action, the distance from the muzzle where the fuzes armed, and the time and range of self-destruction.

### 5. PERIOD OF TEST:

a. b.	Date of Authorizing letter Dates Material Received	6 August 1952 1 March 1951 to
	Date Commenced Test Date Test Completed	6 April 1953 19 September 1952 11 May 1953

### 6. REPRESENTATIVES PRESENT:

One (1) or more of the following representatives were present to witness portions of the ballistic tests reported herein:

Mr. M. Mr. P. Mr. E.	A. A. V. B. L.	Buck Browning M. Korty Morgan Morgan	Naval Naval Naval Naval	Ordnance Ordnance Ordnance Ordnance Ordnance	Laboratory Laboratory Laboratory Laboratory Laboratory Laboratory Laboratory
Mr. R.	$H_{\bullet}$	Suessle	Naval	Ordnance	Laboratory

### PART C

### DETAILS OF TEST

### 7. DESCRIPTION OF ITEM UNDER TEST:

The Oerlikon 20mm fuzes, types KZ and BZ, are described in detail in Oerlikon Machine Tool Works Brochures 932, 950, 1012, 1053, 1054, 1099, and 1143. The KZ nose fuze and BZ base fuze have direct action firing pins restrained by safety bolts and are armed by set back and spin. The self destruction feature of both types depends upon decreased spin with range for operation. The type KZ nose fuze has a prolonged muzzle safety device designed to prevent arming within a fifty (50) meter range of the muzzle, but to arm completely after a flight distance of one-hundred-fifty (150) meters.

### 8. DESCRIPTION OF TEST EQUIPMENT:

- a. The two (2) types of fuzes tested were part of fixed ammunition received from the Oerlikon Machine Tool Works. Fuzes and projectiles were assembled as follows:
- (1) The KZ nose fuze in a 120 gram SS/K pointed explosive projectile loaded with 13 grams of Pentryl.
- (2) The BZ base fuze in a 150 gram PS/B armor piercing explosive projectile loaded with 8.0 grams of Trotyl.

### b. Gun:

Oerlikon 20mm 5TG Gun, Mechanism NR 6, with Barrels NR-164 and NR-190, 100.7" length, 1/32.6 calibers twist, mounted on a modified one-pounder stand.

### c. Case, Powder:

No information was available on the case or propellant used.

### d. Targets:

- (1) Blotter paper, Beaverboard (01190-.58 lbs/ft2).
- (2) Aluminum alloy, 24S-T4 clad in thickness of 0.016.
- (3) Aluminum alloy, 24S-T3 or 24S-T4, in thicknesses of 0,020, 0,040, 0,125, and 0,500.
- (4) Cold rolled strip steel in thickness of 0"125 in dead soft temper at Rockwell B hardness 45\*7.
- e. A 160' range with armor plate butt, target mounting jig, and velocity measuring equipment.
- f. A 525' open range with target mounting jig and velocity measuring equipment.

### 9. PROCEDURE:

### a. Functioning and Sensitivity Tests:

With the concurrence of the representatives present, the KZ and BZ fuzes as assembled in fixed ammunition were fired from the Oerlikon 5TG gun versus targets listed in paragraph 8(d) set at various obliquities. At fifty (50) feet forward of the muzzle, rounds assembled with KZ nose fuzes gave mean velocities of 3619 to 3731 ft/sec and rounds assembled with BZ base fuzes gave mean velocities of 3254 to 3315 ft/sec. Beaverboard, chipboard, or blotter paper was placed behind the target for most firings to determine fuze action on the target and to determine the approximate distance of delayed fuze action. Blotter paper was placed slightly forward of the target on some rounds to measure yaw. Detailed conditions of test are given in Appendices (B) and (C).

### b. Arming Distance Tests:

Arming distance tests were conducted with the KZ nose fuze only. The rounds assembled with KZ nose fuzes were fired with service propellant charges versus 0"125 mild steel placed 50 to 500 feet from the muzzle. Results of the tests are given in detail in Appendix (C).

### c. Self Destruction Tests:

With a gun elevation of 4°, rounds assembled with the KZ and BZ fuzes were fired down river to determine the approximate time and range of self-destruction. Time of self-destruction was measured by two (2) stop watches. Range of self-destruction was determined by two (2) down river observation stations. These two (2) stations took bearings on the burst, and a "fix" was obtained from these bearings. The details of test are given in Appendices (B) and (C).

### 10. RESULTS AND DISCUSSION:

- a. Results of all tests are given in detail in Appendices (B) and (C).
  - b. Functioning and/or Sensitivity tests of the BZ Fuze.
- (1) The results obtained using the BZ base fuze assembled in the PS/B armor piercing explosive projectile are summarized in Table I, Appendix (A). One (1) round is not included in Table I because fuze action could not be definitely determined.
- (2) With the concurrence of the representatives present, functioning and/or sensitivity tests of the BZ base fuze were not completed because of excessive yaw. This yaw was estimated to be as much as 20° on some rounds. I new barrel was used in an attempt to eliminate the yaw. When the projectiles continued to yaw, the range was increased from 160 to 500 feet. Yaw was evident at 500 feet and the tests were terminated because it was not considered feasible to conduct a fuze functioning test with an unstable projectile. Figure 1, Appendix (D), is a photograph of the yaw cards showing the extent of yaw of the PS/B round.
- (3) The Bureau of Ordnance requested additional information on the BZ fuze because a fuze with an inherent delay feature is desired for use with the 20mm Mk 12 gun. In view of the above fact, the Naval Ordnance Laboratory examined some of the PS/B rounds assembled with BZ fuzes and found they were not consistent. X-ray examination showed that some rounds had lead in the projectile cavity. Since this lead varied in amount and shape from one round to another, the Naval Ordnance Laboratory thought this might be the cause of yaw. Sixteen (16) rounds, comprised of eight (8) rounds with lead in the projectile cavity and eight (8) rounds with no lead in the cavity, were shipped to the Naval Proving Ground for testing to determine whether the lead in the cavity was the cause of yaw and also to compare the amount of yaw with fuze action.
- (4) The rounds fired on 14 April 1953 that were known to have load in the projectile cavity exhibited slightly more yaw but a better functioning performance than the rounds that were known to have no lead in the cavity.

- (5) As may be noted in Table I, Appendix (A), an overall functioning performance of 65% was obtained with the BZ fuze versus 0"125 mild steel at 0° obliquity with mean velocities of 3254 to 3315 ft/sec. The low performance at those conditions might possibly have been caused by the excessive yaw, and therefore the results obtained are considered inconclusive.
- (6) When fired against a target of 0"125 mild steel at 0° obliquity with mean velocities of 3257 to 3315 ft/sec., the BZ base fuze exhibited a slight delay in fuze action of approximately .001 second. Figure 1, Appendix (D), is a photograph showing typical delayed fuze action.
  - c. Functioning and/or Sensitivity Tests of the KZ Fuze:
- (1) Results of all tests of the KZ nose fuze assembled in the pointed SS/K explosive projectile are given in detail in Appendix (C) and are summarized in Table II, Appendix (A).
- (2) As noted in Table II, Appendix (A), the KZ nose fuze exhibited a satisfactory (100%) functioning performance at 0 obliquity versus 0"125 24S-T3 aluminum alloy and all heavier targets employed.
- (3) The KZ fuze functioned 100% against 0.020 24S-T3 aluminum alloy at 30° obliquity and 0.125 24S-T3 aluminum alloy at 80° obliquity.
- (4) The KZ fuze gave a functioning performance of 80% or greater versus 0.020 24S-T3 aluminum alloy at obliquities of 0° to 70°, 0.125 24S-T3 aluminum alloy at obliquities of 0° to 80°, and versus 0.190 Beaverboard, 0.040 24S-T3 aluminum alloy, and 0.016 24S-T3 clad aluminum alloy at 0° obliquity.
- (5) The KZ fuze was sensitive enough to function 40% on 0,020 blotter paper at 0 obliquity.
- (6) When fired against thin targets of 0.016 to 0.040 24S-T3 aluminum alloy at 0° obliquity with mean velocities of 3619 to 3731 ft/sec., the KZ nose fuze exhibited a slight delay in fuze action of approximately .00015 second.

CONFIDENTIAL

Tests of Oerlikon BZ and KZ Fuzes for 20mm Ammunition

### d. Arming Distance Test:

The results of the arming distance tests of the KZ fuze are given in detail in Appendix (C) and summarized in Table III, Appendix (A). The KZ nose fuze was not armed at 50 feet from the muzzle, was at times armed at 100 to 450 feet from muzzle, and was armed 100% of the time at a distance of 500 feet from the muzzle when fired with a mean velocity of 3619 to 371? ft/sec against a 0"125 mild steel target.

- e. Self-destruction of the KZ and BΣ Fuzes:
- (1) Twenty-five (25) rounds each of types KZ and BZ fuzes were fired to determine self-destruction time and range. The results are given in detail in Appendices (B) and (C).
- (2) The self-destruction mechanism operated on twentythree (23) or 92% of the BZ fuzes at an average range of 2287.4 yards and an average flight time of 4.60 seconds.
- (3) The self-destruction mechanism operated on twentytwo (22) or 88% of the KZ fuzes at an average range of 2842.3 yards and an average flight time of 5.47 seconds.

### PART D

### CONCLUSIONS

- 11. It is concluded from the results obtained that:
- a. The KZ and BZ fuzes gave no bore or flight premature detonations when fired as single rounds from the Oerlikon 5TG gun.
- b. The BZ base fuze assembled in the PS/B armor piercing explosive projectile when fired with mean velocities of 3254 to 3315 ft/sec:
- (1) Was unstable in flight and fuze functioning was not determinable.
- (2) Gave a slightly better functioning performance but yawed slightly more with projectiles known to have lead in the cavity. (Based upon limited comparative firings of projectiles with and without lead in the cavity.)

CONFIDENTIAL SECURITY INFORMATION

- (3) Exhibited a 92% self-destruction performance at an average range of 2287.4 yards from the muzzle with an average flight time of 4.60 seconds.
- (4) Detonated with delayed fuze action of approximately .001 second when fired against a 0125 mild steel target.
- c. The KZ nose fuze assembled in the SS/K explosive projectile when fired with mean velocities of 3619 to 3731 ft/sec:
- (1) Functioned 100% versus 0"125 24S-T3 aluminum alloy and all heavier targets employed at 0° obliquity.
- (2) Functioned 100% against 01020 24S-T3 aluminum alloy at 30° obliquity and against 01125 24S-T3 aluminum alloy at 80° obliquity.
- (3) Gave a functioning performance of 80% or greater against: 0"020 24S-T3 aluminum alloy at obliquities of 0° to 70°, 0"125 24S-T3 aluminum alloy at obliquities of 0° to 80°, versus 0"190 Beaverboard, 0"040 24S-T3 aluminum alloy, and 0"016 24S-T3 clad aluminum alloy at 0° obliquity.
- (4) Was sensitive enough to function 40% on 01020 blotter paper at 0° obliquity.
- (5) Was not armed at 50 feet from the muzzle, but was fully armed at a distance of 500 feet from the muzzle when fired against a target of 0125 mild steel.
- (6) Exhibited an 88% self-destruction performance at an average range of 2842.3 yards with an average flight time of 5.47 seconds.
- (7) Detonated with delayed fuze action of approximately .00015 second when fired against thin targets of 0.016 to 0.040 24S-T3 aluminum alloy at 0 obliquity.

The tests upon which this report is based were conducted by:
